Problem Statement

Current Process is Manual and Inefficient!

Key Issues

- Time-consuming manual work
- Inconsistent data formatting
- Limited Scalability
- No real-time visibility

How can we transform this into an intelligent, automated system?

Urgency

HIGH

Recommendation Staffed Event

Tags

High-need zip 55411

250 attendees — large event

Event in 8 days — urgent

Bilingual materials required

Summary

Staffed health fair in high-need Minneapolis neighborhood — 250 attendees, bilingual materials needed, 8 days away.

Proposed Solution : AI-Powered Request Management System

- Automated request classification
- Structured data capture
- Real-time dashboard for administrators

Our Structure

Frontend / Web Server

- TypeScript (Vite + React)
- HTML / CSS (UI templates & Styling)
- Vercel

Backend / AI

- Python (AI Agent & Automation Logic)
- Claude Sonnet 4.6 (LLM Function Calling)
- Agent API Railway

Database / Full Stack

- Supabase (PostgreSQL Schema & Migrations)
 - Automatically encrypt sensitive data with AES-256
- Cursor

A.I. Tool: Claude Sonnet 4.6

Step	Tool	What it does
1	validate_and_flag	Checks if all critical fields are present and consistent. Flags missing or suspicious data. Generates a one-line summary for admin.
2	check_service_area	Uses ZIP code to determine if request is within service area and identifies high-need regions.
3	classify_request	Determines fulfillment type: staffed_event, mailed_materials, or pickup. Also categorizes material type.
4	calculate_priority	Assigns priority (high / medium / low) based on urgency, attendees, location, and data completeness.

Priority	Criteria
HIGH	Event within 14 days, 100+ attendees, high-need ZIP, or missing critical info
MEDIUM	Event within 30 days, 50–99 attendees
LOW	Event more than 30 days away, fewer than 50 attendees

Tool	What it does
create_calendar_event	Creates a calendar invite (title, date, location, attendees, staffing notes)
send_notification	Sends a professional approval email to the request submitter
